## 1 SCOPE

### 1.1 Identification

Version Description Document,  
Ada PCTE Binding (AdaPCTE),  
Δ Version 0.3,  
SunOS Implementation

### 1.2 System Overview

The Ada Portable Common Tool Environment (PCTE) binding (AdaPCTE) provides Ada applications access to a PCTE object base as defined by the European Computer Manufacturers Association (ECMA) Ada PCTE specification (Standard ECMA-162 Ada Language Binding, December 1991). This "alpha" release provides a minimal set of interfaces to permit Ada developers to experiment with and evaluate PCTE for use in future Ada applications. It is expected that later releases will complete the binding.

## 2 RELATED SOFTWARE

Since no conforming implementations of ECMA PCTE exist as defined in Standard ECMA-149, AdaPCTE is implemented on GIE Emeraude's PCTE V12.2 Fix 7 or V12.3. Because Δ only a subset of the ECMA PCTE Ada specification has been implemented for the 0.3 release, and because ECMA PCTE functionality differs somewhat from Emeraude PCTE functionality, the complete functionality of Emeraude PCTE is not available to Ada applications using these bindings.

## 3 VERSION DESCRIPTION

### 3.1 Inventory of Contents

The AdaPCTE distribution is structured as shown below. The top-level directory *adapcte* includes PostScript (**VD Dadapcte.ps**) and clear ASCII text (**VD Dadapcte.tty**) versions of this document, along with a complete directory listing of the distribution (**Contents.tty**, reproduced herein as **Appendix A**).

#### Δ 3.1.1 Directory: *adapcte/code*

The *adapcte/code* directory contains the Ada source files for the Ada binding to PCTE and the UNIX C-shell script *Build\_AdaPCTE.csh*. *Build\_AdaPCTE.csh* can be used to build Δ the entire AdaPCTE Binding using the SunAda 1.1 Development System. No provisions within the build script have been made for installing the bindings in the PCTE object base.

Applications being developed on these bindings are expected to be developed within a UNIX environment and executable code files may be installed by the user in the PCTE object base (but are not required to be installed in the object base). The build script is reproduced herein as **Appendix B.2**.

### 3.1.2 Sub-directory: *adapcte/code/C*

This directory contains a small C file, *util.c*, containing utility routines used by AdaPCTE. The build script compiles this file in the target directory as *util.o*. Applications are required to add this file to any link commands for applications developed with these bindings.

## 3.2 Changes Installed

### △ 3.2.1 Version 0.3

In the original ECMA-162 Ada Language Binding specification for the file *Pcte.a* a generic package specification for sequences was declared and instantiated before the package body was elaborated. This violates MIL-STD-1815A-1983 (the Ada Reference Manual). The SunAda 1.0 compiler did not enforce generic package elaboration before instantiation. The SunAda 1.1 compiler now enforces this, so to successfully compile and execute AdaPCTE-based applications, the generic sequences package and it's body were moved to a separate compilation unit. This caused several minor changes to other AdaPCTE files, and may require changes to applications using the AdaPCTE bindings. Application changes should be limited to changing data types of parameters passed to procedures in the sequences package.

The ECMA standards group responsible for the ECMA-162 has been notified of the problem, and a description of changes made to AdaPCTE provided. Future releases of the standard may differ from the specifications in AdaPCTE 0.3. ECMA changes will be incorporated in future releases of AdaPCTE.

Files affected were:

```
Pcte.a
Pcte_accounting.a
Pcte_audit.a
Pcte_b.a
Pcte_discretionary.a
Pcte_oms.a
Pcte_process.a
Pcte_process_b.a
Sequences.a
Sequences_b.a
```

Several inconsistencies between standard Ada text input-output and PCTE text input-output were discovered. Changes were made to *pcte\_text\_io* so that *get* and *end\_of\_line* work as in standard Ada text input-output. Files affected were:

*Pcte\_contents\_b.a*  
*Pcte\_text\_io\_b.a*

### 3.2.2 Version 0.2

Added to this version are Ada Input Output packages that support text, sequential, and direct input output to PCTE objects with contents. The specifications of these packages match the standard Ada input output routines defined in the Language Reference Manual. The package bodies have been rewritten to access PCTE objects. The packages are specified in *pcte\_text\_io.a*, *pcte\_direct\_io.a*, and *pcte\_sequential\_io.a*.

To support access to Emeraude PCTE objects a package *pcte\_support* was added. This package provides constants for accessing standard PCTE objects (e.g., common root, home object), and routines for manipulating Emeraude PCTE path names.

The procedure *list\_all\_links* in package *Pcte\_object* was extended to permit applications to request a listing of links based on an application supplied list of link types.

## 3.3 Adaptation Data

### 3.3.1 Operating Environment

Sun-4 Workstations

SunOS, Version 4.1.2

Emeraude PCTE V12.2 Fix 7 or V12.3

### 3.3.2 Development Environment

Sun-4 Workstations (32 MB main memory, 100 MB swap space)

SunOS, Version 4.1.2

Emeraude PCTE V12.2 Fix 7 or V12.3

Δ SunAda 1.1

C compiler

### 3.4 Interface Compatibility

AdaPCTE uses the recently adopted standard ECMA-162 for the Ada binding specification. Because no ECMA PCTE implementation is available, AdaPCTE is bound to GIE Emeraude's PCTE 1.5 V12.2 or V12.3 implementation written in "C". As a result, the AdaPCTE specification contains some minor modifications to ECMA-162. The exact specification of the implemented binding can be found in the Ada package specifications located in the directory */adapcte/code* in this delivery.

### 3.5 Installation Instructions

File *adapcte/code/Build\_Adapcte.csh* is an executable UNIX C-shell script, which can be used interactively to build the AdaPCTE Binding from the Ada source code, using the SunAda 1.0 system. It ensures that library dependencies are established correctly, making it unnecessary for the installer to perform these operations manually.

#### 3.5.1 Build Procedure

1. (*OPTIONAL*) - To prevent interactive prompting when executing the script, uncomment and edit the environment variables at the beginning of file *code/Build\_Adapcte.var* (see **Appendix B.1**) to reflect the actual operating environment. The following environment variables must be modified:

*AdaPCTE* - identifies the full pathname of the directory into which the AdaPCTE distribution has been loaded (e.g., */local/adapcte*);

*COMPILERNAME* - identifies the name of the compiler to be used;

*COMPVERSION* - identifies the compiler version;

*COMPILERPATH* - identifies the full pathname of the directory containing the SunAda compilation system (e.g., */local/sunada1.0*);

*TARGET* - identifies a *Build* directory to be used for building the software.

2. Execute *Build\_Adapcte.csh*, providing configuration information when prompted by the script.

## 4 USER FEEDBACK

This version of AdaPCTE is considered an "alpha" release. The primary purpose of the release is to encourage experimentation with the software and to solicit feedback from the Ada and PCTE user communities. Thus, we would greatly appreciate your comments, suggestions, and criticisms.

## 5 NOTES

The full set of PCTE path names as described in the ECMA PCTE Abstract Specification (149) has not been implemented for this release. The following characters “\_”, “.”, “~”, and “/” plus alphanumeric characters are valid characters in AdaPCTE path names. The following are examples of valid AdaPCTE path names:

```
./sun4.tools
~/history.e
```

△ AdaPCTE Version 0.3 has not implemented all the interfaces defined in ECMA-162. The following describes which interfaces are implemented in Version 0.3 including any limitations.

```
Package Sequence
  function get
  procedure put
  procedure delete
  procedure copy
  function length_of
  function index_of
  function equal
  procedure normalize

Package Pcte
  Package Reference
    -- These procedures use a limited form of path names as defined
    -- in the abstract spec. You can use ~, _, ., . . . , / plus ascii
    -- characters
    function get_path
    procedure set_absolute
    procedure set_relative
    procedure unset
    -- New operations added by VFEC
      function get_reference_id
      procedure set_reference_id

Package Pcte_contents
  -- This package is only implemented for files; no pipes or devices
  procedure close
  function get_position
  procedure open
  function read
  procedure seek
```

```
procedure set_position
procedure set_properties
procedure write
-- New operations added by VFEC
procedure standard_input
procedure standard_output
procedure standard_error
function end_of_contents
procedure write_s
    -- (writes a string)
procedure read_s
    -- (reads a string)

Package Pcte_error
procedure set
procedure unset
procedure set_will_raise
procedure set_will_record
function will_raise
function will_record
function last_error

Package Pcte_object
procedure create
    -- can not specify another volume
procedure delete
procedure get_attribute
    -- for boolean, integer, natural and string types only
procedure get_several_attributes
    -- for boolean, integer, natural and string types only
function get_type
procedure list_all_links
    -- does not support EXTERNAL extents
    -- does not support COMPOSITE scopes
    -- ignores links parameter
    -- none of the other 8 procedure variations of
    -- object_list_links is supported

Package Pcte_process
procedure create_and_start
    -- no process objects created; just fire up a process
    -- local execution site only
procedure set_working_schema
    -- for current process only
procedure wait_for_any_child
```

```
procedure wait_for_child

package Pcte_sds
  procedure get_link_type_properties
  procedure get_object_type_properties
  function get_type_name
    -- ignores any sds param value other than IN_WORKING_SCHEMA

package Pcte_link
  procedure get_attribute
    -- for boolean, integer, natural and string types only
  procedure get_several_attributes
    -- for boolean, integer, natural and string types only
```
